

PiloXin™ After Shave Balm

Slows Hair Regrowth

PiloXin After Shave Balm is clinically proven to reduce the frequency of shaving.

PiloXin contains a unique organic amino acid blend that gets to the root of hair removal. It penetrates the hair follicle and interferes with the hair's ability to regenerate itself.

Clinical studies have proven to decrease the number of times you have to shave by 50% within 4 - 8 weeks of regular use. Men that shave every day will be able to shave 3 - 4 times a week without having stubble on the second day. Women who shave their legs every week will be comfortable shaving every other week. Continued regular use will further reduce the need to shave. **We offer a 100% satisfaction guarantee.**

DIRECTIONS: After shaving, rinse the area well with warm water. Pat dry with a soft towel. Apply PiloXin™ After Shave Balm to all shaved areas. Gently massage the silky lotion until it completely disappears into your skin. For best results, use every time you shave and use immediately after shaving.

FEATURES & BENEFITS:

- Contains Depiline™ (Sederma, France), a new vectorised form of naturally derived Palmatine. This compound has been clinically proven to reduce hair growth by up to 48% after just two months of regular use after shaving.
- Contains Papain, a special enzyme from Papaya Fruit. This enzyme helps to gently digest surface hairs, making them appear lighter and less voluminous.
- Contains Bisabolol, a selected derivative of the Chamomile plant, to help reduce redness and razor burn.
- Contains Allantoin for its proven, soothing effects on sensitive skin.
- Contains Vegetable Glycerin and Vegetable Triglycerides, working together to help keep your skin smooth, soft and moisturized for hours after shaving.
- Alcohol-Free formula is ultra-soothing, never stinging.
- Suitable for all skin types.
- Perfect for men or women.
- pH-balanced for optimum performance.
- Not tested on animals.

CLINICAL TESTING SUMMARY REPORT

PILOXIN™ ONE-STEP After Shave Balm

Determination of Product Acceptance, Tolerance and Efficacy of PILOXIN™ After Shave Balm as determined by an testing laboratory - October 31, 2007.

CONCLUSIONS:

In effect, 81% of the volunteers reported that their skin felt either comfortable or very comfortable after application of the After Shave Balm. In terms of sensory attributes, the texture and the absorption of the After Shave Balm were both appreciated (by over 90%), and the majority of the volunteers enjoyed the feeling after application. Skin feel was also considered normal by 71% of the respondents. A majority (86%) perceived slight to significant improvements in skin smoothness and firmness imparted by the application of the After Shave Balm. 76% agreed that the After Shave Balm improved the hydration of their skin on the treated leg. The perception of product efficacy in reducing hair growth and hair coarseness was also positive. A slight to moderate reduction in hair growth rate was perceived by 90% of the volunteers and reduction in hair coarseness by 86% of the respondents. More than half of the volunteers (52%) would recommend the balm to a friend.

Clinical Study 07AB-0618 performed by Evalulab in Quebec, Canada - October 31, 2007. Complete clinical studies are available upon request.

DERMATOLOGIST TESTED

Determination of Cutaneous Tolerance and Sensitization on 50 Healthy Human Volunteers by Human Repeat Insult Patch Test (HRIPT) - supervised by a Dermatologist.

RESULTS:

PILOXIN™ One Step After Shave Balm - Non-Sensitizing and Hypo-Allergenic. Study 09F-0126-05
